"Rolling stock in the railway system" is a technical book in three volumes intended for industry professionals as well as railway enthusiasts. The work was written by engineers from several major European companies and of seven different nationalities. It takes stock of the modern techniques applied to rolling stock, while placing it within a rapidly evolving railway system, following the opening of the European borders. The third volume deals with all systems that control the operations of the train. A first chapter (chapter 8) is dedicated to traction systems (electric traction and thermal traction), and a second one (chapter 9) to braking systems and air production, then chapter 10 deals with train control and monitoring. Another chapter is dedicated to all systems when embedded in locomotives (chapter 11) and chapter 12 describes the driver's environment. At the end, chapter 13 gives some hints on what might be the technical features of rolling stock in the near future. The other volumes are available as separate items: The first volume of the three volume work acquaints the reader with the railway world and railway rolling stock by a historical approach (chapter 1), followed by a description of the railway system (chapter 2), and an analysis of the...
